# Customer Order Tracking Portal — BA Case Study

## Overview

**Prepared by:** Cameron Preston
**Date:** March 31, 2026

## 1. Executive Summary

This case study outlines the analysis and solution design for addressing declining customer satisfaction caused by limited order visibility. The goal was to design a self-service customer portal that reduces reliance on support while improving overall customer experience.

## 2. Business Problem

Customer satisfaction has declined due to lack of visibility into order status. Customers are required to contact support for updates, resulting in:

- High support call volume
- Increased operational strain
- Decreased customer retention

## 3. Objectives

- Enable self-service order tracking
- Reduce support call volume
- Improve customer experience
- Increase customer retention

## 4. Stakeholders

- Product Manager

- Engineering / IT Team
- Customer Support Team
- Marketing Team
- Leadership

## 5. Current State Analysis

- No customer-facing tracking system
- Customers must call or email support
- Backend updates only twice daily
- Support team overwhelmed with requests

## 6. Constraints & Considerations

- Backend system does not support real-time updates
- Data refresh occurs twice daily
- 8-week delivery timeline
- Must integrate with existing infrastructure

## 7. Approach

- Conducted stakeholder discussions to gather requirements
- Identified key pain points and system limitations
- Translated business needs into epics and user stories
- Prioritized requirements based on MVP delivery

## 8. Proposed Solution

Develop a customer-facing portal that allows users to:

- Enter order number
- View order status

- Understand update frequency
- Contact support if needed

# 9. Process Flow

**Current Process (Before)**
Customer → Contact Support → Wait → Receive Update

**Future Process (After)**
Customer → Portal → Enter Order → View Status → Contact Support

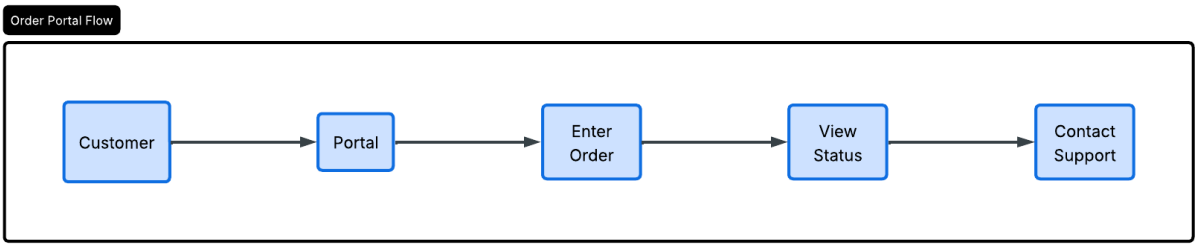

*Figure 1: Customer Order Tracking Process Flow*

# 10. Epic Definition

**Epic Name:** Customer Order Tracking Portal

**Description**

Provide customers with a self-service order tracking solution to enable visibility into order status, reduce reliance on support, and improve overall customer experience.

**Business Objectives**

- Reduce support calls
- Improve customer satisfaction
- Increase retention

**Constraints**

- Backend updates twice daily
- 8-week timeline

### Out of Scope

- Real-time tracking
- Order cancellations
- Email notifications

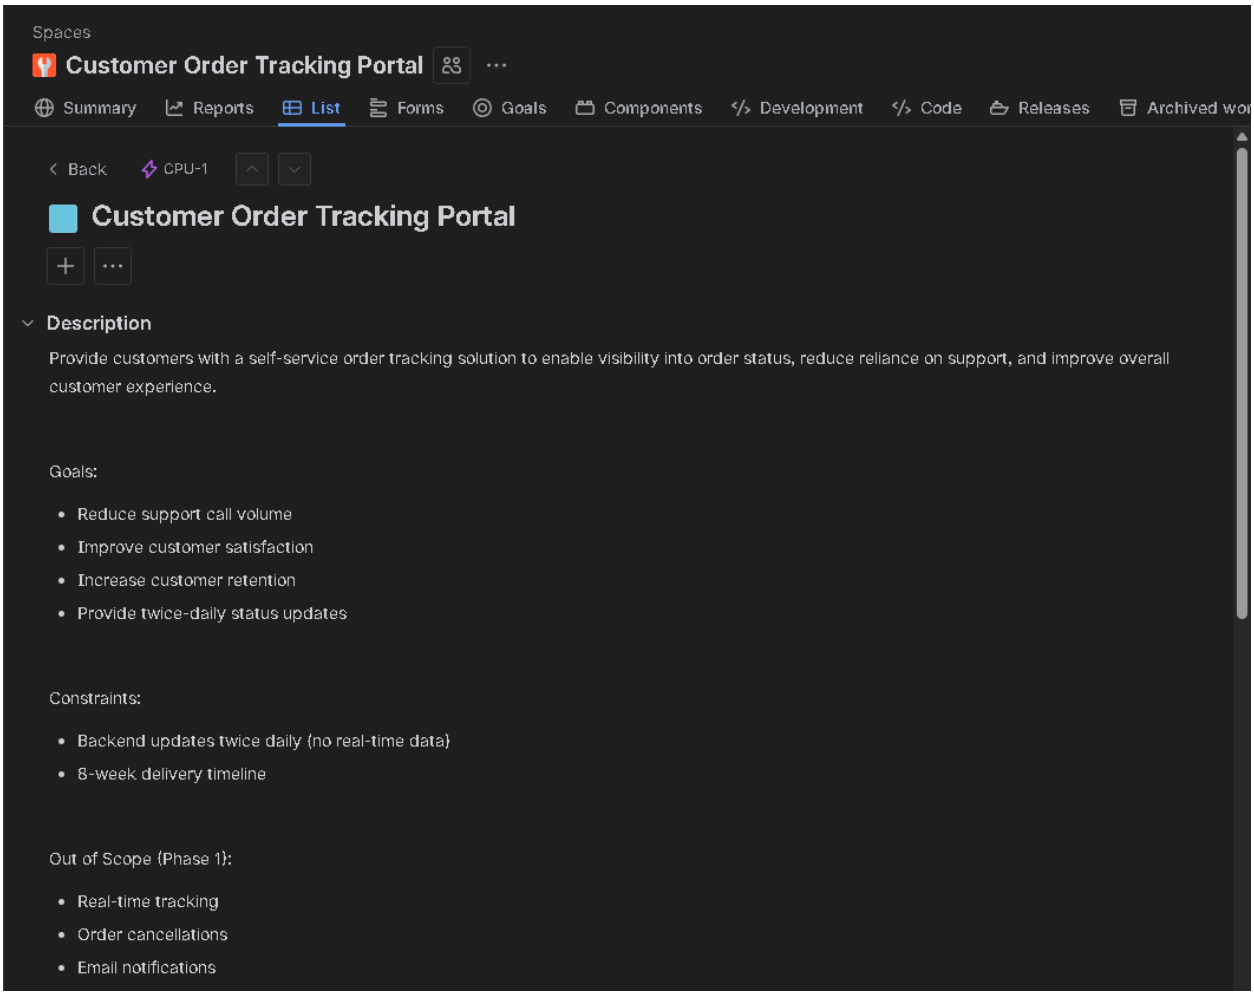

*Figure 2: Jira Epic for Customer Order Tracking Portal*

## 11. User Stories

### Story 1: Order Lookup

As a customer, I want to enter my order number so that I can view my order status.

### Story 2: View Order Status

As a customer, I want to view my order status so that I understand where my order is.

### Story 3: Display Update Timing

As a customer, I want to know how often my order updates so that I understand when to expect changes.

### Story 4: Contact Support

As a customer, I want to contact support if needed so that I can resolve issues.

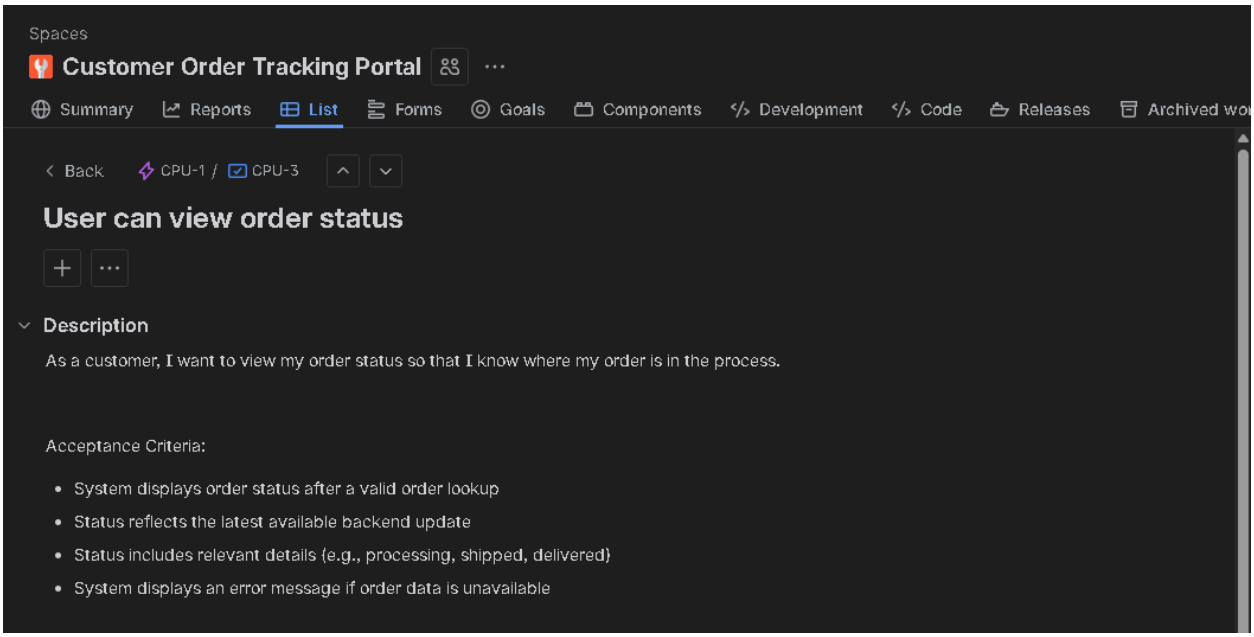

*Figure 4: User Story #2 Breakdown in Jira*

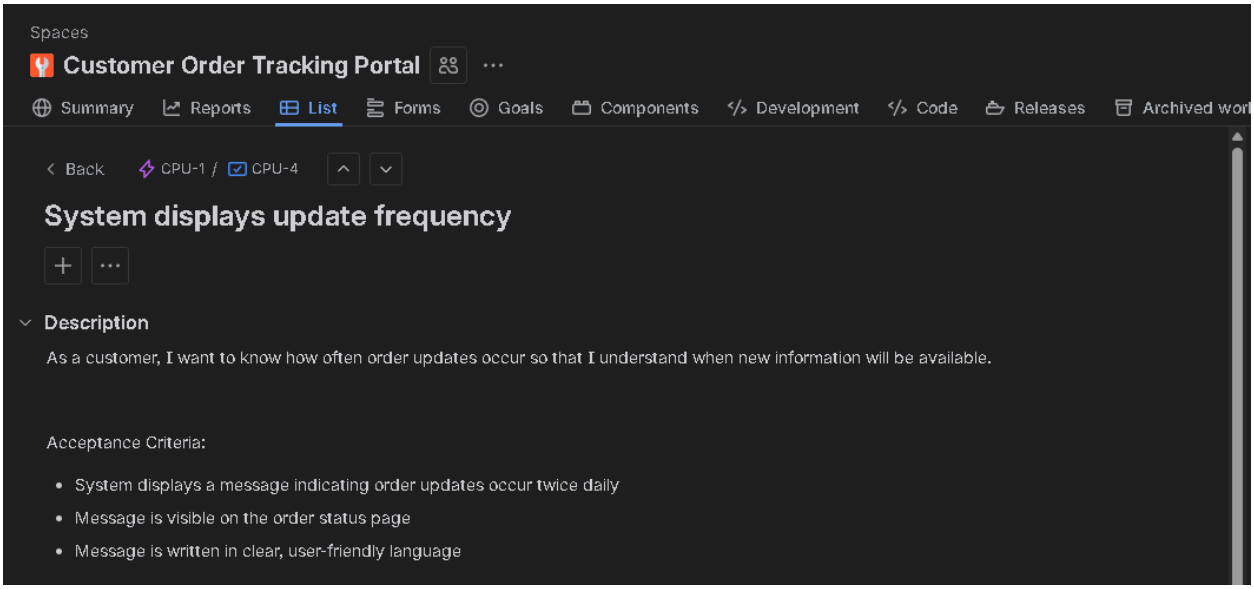

*Figure 5: User Story #3 Breakdown in Jira*

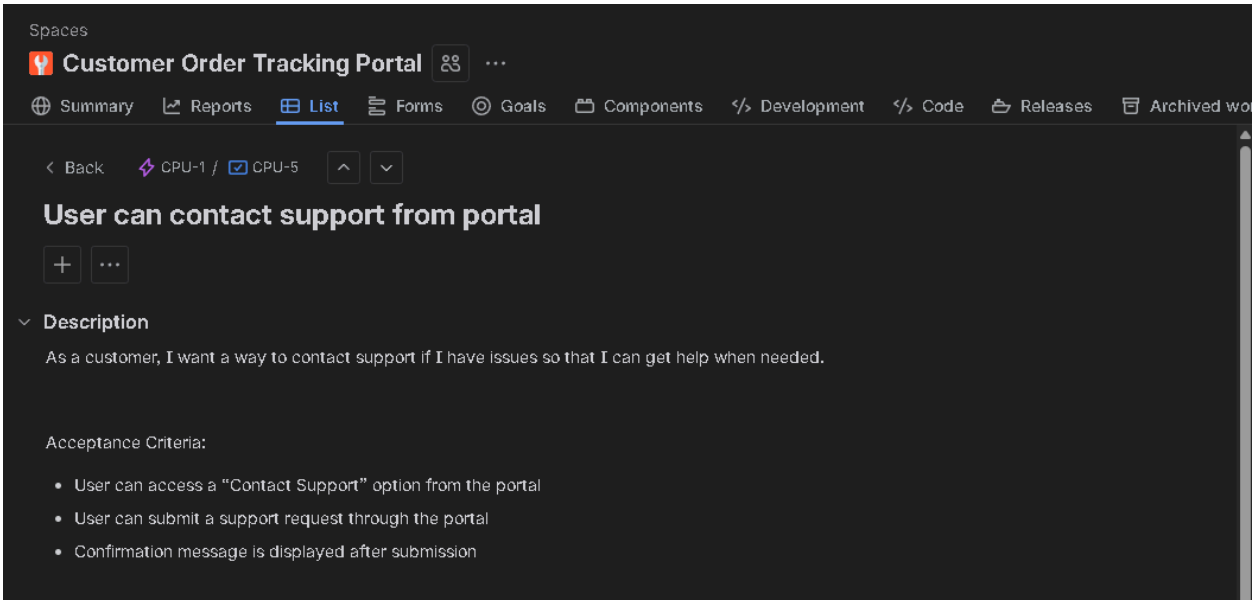

*Figure 6: User Story #4 Breakdown in Jira*

# 12. Acceptance Criteria

### Order Lookup

- User can enter order number
- System returns matching order
- Error shown if invalid

**View Order Status**

- System displays current order status
- Status reflects latest backend update
- Error shown if unavailable

**Display Update Timing**

- System displays update frequency message
- Message is visible and clear

**Contact Support**

- User can access support option
- User can submit request
- Confirmation message is shown

## 13. Expected Outcomes

- Reduction in support call volume
- Improved customer satisfaction
- Increased customer retention

## 14. Reflection

This project helped me get comfortable turning a loosely defined problem into clear, structured requirements. It also reinforced the importance of asking the right questions, aligning on business goals, and working within technical constraints. Focusing on a simple MVP solution showed how delivering core functionality first can create immediate value while leaving room for future improvements.
